Permission usage

[instagram_business_basic] Tell us how you're using this permission or feature

1. How we use this permission & why it's necessary Our product: OnGram / Walnut is a creator marketplace. Creators sign in with Instagram (Instagram Login, not Facebook Login). We need instagram_business_basic so we can call the Instagram Graph API on behalf of the authenticated Instagram professional (Creator/Business) account. What we use it for: Account identity & profile basics After OAuth, we use the access token to read basic Instagram account metadata needed to operate the product: notably username and Instagram user id, and related profile fields returned by GET /me on graph.instagram.com (as implemented in our integration). This lets us: Know which Instagram account is connected to which marketplace user. Show the creator's public handle and linked identity in the app (e.g. creator profile). Avoid relying only on manual typing of handles for core flows. Operational integrity We persist a stable link between our user record and the Instagram professional account so login, reconnect, and profile sync behave consistently. Why this permission is required: Without instagram_business_basic, we cannot obtain authorized access to Instagram Graph /me (and related basic profile context) for Instagram Login-based creators. That breaks Instagram-only creator authentication and accurate display of the connected professional account in our UI. Analytics / insights note: If we call /{media-id}/insights or similar, we only use metrics to operate creator-facing features (e.g. eligibility, campaign performance context) and internal product improvement, in line with Meta's rules for aggregated/anonymized use where applicable. We do not sell Instagram data to third parties. 2. Value for the person using the app Trust: They see their real Instagram @username tied to their account, not a fake or manual entry. Speed: They don't re-enter identity details we can read from Instagram after consent. Safety: Connection is OAuth—we don't ask for their Instagram password. 3. Reviewer testing instructions App credentials for reviewers (example structure — fill with your real values): Meta App ID (Instagram product): [YOUR INSTAGRAM APP ID / CLIENT ID] Instagram Login is enabled for this app; reviewers use their own Instagram professional (Creator or Business) account to connect. Redirect URI registered in Meta (must match exactly): [YOUR PRODUCTION INSTAGRAM REDIRECT URI, e.g. https://www.ongram.in/api/auth/instagram/callback] (Use the exact value from your Meta app → Instagram → Basic settings → Valid OAuth Redirect URIs.) Environment note: Reviewers test against production at https://www.ongram.in (or your App Review URL if different). Steps for the reviewer: Open https://www.ongram.in/login/creator (or your documented creator entry URL). Choose Continue with Instagram / Instagram login (wording as shown on your page). Complete Instagram OAuth and approve instagram_business_basic when prompted. After login, open https://www.ongram.in/creator/profile (or ...?onboarding=1 if you route new users there). Where Instagram professional profile information appears: Primary identity: Instagram @username as the main profile title (when successfully resolved). Secondary: Display name / "Instagram creator" line under the title where applicable. Profile photo / link: Shown or linked per your current UI (note honestly: if avatar is sometimes loaded via non-API fallback, you can say "profile image may be enriched via permitted endpoints or fallback mechanisms" to avoid overstating API-only behavior). Optional: Use "Update from Instagram" / sync control on the profile page to trigger a refresh that uses the stored token and Graph access paths your app implements. What the reviewer should observe: After connecting their Instagram professional account, the app displays their Instagram handle and identity context on the creator profile screen, confirming instagram_business_basic is used for its intended purpose.

[instagram_business_basic] Provide a detailed step-by-step video walkthrough of how your app will use this permission or feature so we can confirm it is used correctly and does not violate our policies.

- [video](#)

[instagram_business_basic] The instagram_business_basic allows your app to read an Instagram Business account profile's info and media. The allowed usage for this permission is to get basic metadata of an Instagram Business account profile, for example username and ID. You may also use this permission to request analytics insights to improve your app and for marketing or advertising purposes, through the use of aggregated and de-identified or anonymized information (provided such data cannot be re-identified).

If approved, I agree that any data I receive through instagram_business_basic will be used in accordance with the allowed usage.

[instagram_business_manage_insights] Tell us how you're using this permission or feature

Detailed description (permission use, user value, necessity) What OnGram / Walnut is A creator marketplace where creators connect an Instagram professional (Creator/Business) account. Brands run campaigns; creators publish content (e.g. Reels) and the product needs verified performance data from Instagram for active campaigns. How we use instagram_business_manage_insights We use this permission exclusively on behalf of the authenticated creator's own Instagram professional account to call the Instagram Graph API: GET /{ig-media-id}/insights on graph.instagram.com We request lifetime insights for specific media objects tied to the creator's submissions—for example metrics such as views / plays / video_views (depending on media type), plus engagement metrics where applicable (likes, comments, shares, reach, saved, etc.), consistent with Instagram's supported metrics per media type. Concrete product flows Campaign / deal performance verification When a creator submits the public URL of a published Reel (or similar deliverable) on an active deal, our backend resolves the corresponding Instagram media id and refreshes metrics by calling media insights. Those numbers drive what we store and display as delivered performance for that contract (e.g. view counts and related snapshots used for fulfillment and payout-related workflows). This is implemented via server-side sync (syncContractMetrics / metrics refresh and reel-link flows), not manual guesswork. Operational diagnostics (creator-connected token) We may expose insights retrieval through authenticated API endpoints used for creator-side diagnostics (e.g. listing recent media and returning insight rows for a selected media item), so we can validate connectivity and metric availability when troubleshooting creator accounts. Why this permission is necessary View counts and media-level engagement for published Instagram content are not available through profile-only permissions. Without instagram_business_manage_insights, we cannot lawfully retrieve official Instagram insights for the creator's own posts/Reels to measure delivery, support fair reconciliation, and show creators transparent performance tied to their obligations on the platform. Aggregated / anonymized use We may use aggregated or de-identified statistics internally to improve reliability (for example understanding failure modes when metrics are unavailable for certain media types). We do not use this permission to access other users' Instagram data beyond what the authenticated professional account authorizes. Relationship to other permissions (optional sentence) If instagram_business_basic is already approved or requested for identity/login: instagram_business_manage_insights is requested in addition so we can read media insights for fulfillment; it is not requested only as a dependency for messaging or comment management unless you explicitly added those products—adjust if your

dashboard differs.
[instagram_business_manage_insights] Provide a detailed step-by-step video walkthrough of how your app will use this permission or feature so we can confirm it is used correctly and does not violate our policies. • video
[instagram_business_manage_insights] The instagram_business_manage_insights permission allows an app to get insights from the app user's Instagram professional account metadata, posts, photos, and videos; and insights for an Instagram professional account's public profile metadata and media. The allowed usage of this permission is to allow an app to get the insights for the app user's Instagram professional account metadata, posts, photos, and videos; and get insights for an Instagram professional account's public profile metadata and media on behalf of the app user's Instagram professional account. You may also use this permission to request analytics insights to improve your app and for marketing or advertising purposes, through the use of aggregated and de-identified or anonymized information (provided such data cannot be re-identified). If approved, I agree that any data I receive through instagram_business_manage_insights will be used in accordance with the allowed usage.

Data handling

processor-0. Do you have data processors or service providers, including your own companies, that will have access to the Platform Data that you obtain from Meta? Data processors or service providers are separate entities that, on your behalf, process the Platform Data made accessible to you in order to provide you with a service. Please provide the names of any processors that will have access to the Platform Data made accessible to you through the requested permissions and features. "Platform Data" is any data that you receive from Meta (e.g., Meta user ID, email address, profile picture, Meta API user access token, and app secret). No
responsible-1. Who is the person or entity that will be responsible for all Platform Data Meta shares with you? Please provide the name of the legal entity that will control the data (i.e., determine the purposes and means of processing the data) made available to you by Meta through the requested permissions and/or features. This could be a natural or legal person, a public authority, an agency or other entity. In some regions this is called a data controller. Nischal Garg
responsible-2. Select the country where this person or entity is located. India
requests-3. Have you provided the personal data or personal information of users to public authorities in response to national security requests in the past 12 months? This does not include requests related to search warrants or court orders associated with criminal investigations. Personal data or personal information is any data you receive from Meta that relates to an identified or identifiable person. No
requests-4. Which of the following policies or processes do you have in place regarding requests from public authorities for the personal data or personal information of users? Check all that apply. • Data minimization policy—the ability to disclose the minimum information necessary. • Required review of the legality of these requests.

Web reviewer instructions

Provide instructions for accessing the app so we may complete our review. Explain how to navigate to the app, and provide instructions for testing. Use the text below in Meta's "Provide instructions for accessing the app" field. Replace bracketed items with your real values. App access and testing instructions (for Meta reviewers) Product URL (production) https://www.ongram.in Environment Use a desktop web browser (Chrome or Edge recommended). Testing is on live production, not a separate staging URL, unless you give reviewers a different URL. Prerequisites An Instagram professional account (Creator or Business) that the

reviewer controls. Do not share Instagram passwords; the reviewer uses their own account. Our app uses Instagram Login (not Facebook Login). The reviewer will be taken to Instagram to approve the requested permissions (e.g. `instagram_business_basic`, and if enabled in our app, `instagram_business_manage_insights`). App credentials (for our Meta app — not user passwords) Instagram / Meta app ID (Client ID): [YOUR INSTAGRAM APP ID] Valid OAuth redirect URI (must match our Meta app settings exactly): `https://www.ongram.in/api/auth/instagram/callback` (If your production callback path differs, replace with the exact value in the Meta dashboard.) How to open the app and sign in as a creator Go to `https://www.ongram.in/login/creator`. Click "Continue with Instagram" (this starts OAuth via our server route). When redirected to Instagram, sign in with the reviewer's professional Instagram account and accept the permission requests. If the OS tries to open the Instagram mobile app and shows an error, return to the browser and complete the flow in the browser (as noted on the login page). After a successful login, the app will send the reviewer to the creator home (typically `/creator`). Error on URL parameters If the URL contains `?error=...`, read the on-screen message. Common cases: use a Creator/Business account, retry in the browser, or retry after a short wait if the service was temporarily unavailable. Where to verify `instagram_business_basic` (identity / profile) After login, open `https://www.ongram.in/creator/profile`. Confirm that Instagram-connected identity appears as intended (e.g. Instagram `@username` as the primary heading when resolved, and linked profile context). If applicable, use "Update from Instagram" / sync from Instagram on the profile screen to refresh stored profile data using the connected token. Where to verify `instagram_business_manage_insights` (media insights used in-product) Sign in as above. Go to `https://www.ongram.in/creator/deals` and open an active deal (URL shape: `/creator/deals/{contractId}`). For an active deal, submit or confirm the published Reel / content URL for the deliverable when the UI prompts for it. Use refresh metrics / refresh views (or equivalent control on the deal page) so the app calls Instagram Graph `/v1/media-id/insights` for the linked media. Confirm that view counts / performance update and display after the refresh (toast or performance section on the same page). If the reviewer account has no active deals, note that insights are exercised when there is an active contract with a submitted public Instagram URL; you may provide a preconfigured test deal or written steps to create the minimal path (optional sentence you add).

(optional) If payment or membership is required to access the full functionality of this app, provide access codes or test credentials so we can access and review all features on this app. Codes should be active for one year after submission.

(optional) If payment is required to download this app, provide 8–10 gift codes so we can download it from app stores without payment. Codes should be active for one year after submission. Include any codes or test credentials required to access in-app subscriptions, purchases, or features.

(optional) If access to this app or any of its features is limited to users within a specific geographic location or restricted by geo-blocking or geo-fencing, explain the restrictions and provide a list of locations. For example, specify the countries where the app can be accessed.

Include supporting documentation. (Optional) For example, you can upload a screen recording or images that show how to access the app, log in, and how the app uses Meta APIs. You can upload multiple files, maximum 2 GB each. We accept .xls, .xlsx, .csv, .doc, .docx, .pdf, .txt, .jpeg, .jpg, .png, .ppt, .pptx, .mov, .mp4, .zip and .zipx.
